WELCOME

WELL LOGGING DEPARTMENT
OIL INDIA LIMITED
What Is Well Logging?
Well Logging is the technique of making petrophysical measurements in the sub-surface earth formations in order to determine both the physical and chemical properties of rocks and the fluids they contain.

The objective is to locate, define, and produce from a given reservoir.
The Hydrocarbon E & P Process

• Based on seismic and geological surveys, a probable hydrocarbon bearing rock structure is defined, a drilling location is released and a well is drilled

• Once a well has been drilled, it now becomes necessary to ascertain the hydrocarbon potential of the well vis-à-vis the reservoir

• Hydrocarbon potentiality can only be ascertained from analysis of the sub-surface petro-physical data
The Hydrocarbon E & P Process

- Sub-surface petro-physical data obtained from drill coring and cuttings is highly expensive and has many limitations.

- Well logging provides a cheaper, quicker method of obtaining accurate sub-surface petro-physical data.
WELL LOGGING – The Eye of Oil Industry

• Well logging is often called the Eye of Oil Industry

• Well Logging measurements are used to:
  • Ascertain hydrocarbon potential of the well
  • Determine hydrocarbon type and volume
  • Determine what types of fluid will flow and at what rate
  • Optimize well construction and hydrocarbon production

• Well Logging finally serves to:
  • Identify Hydrocarbon Reservoirs
  • Define Total and Recoverable Reserves
WELL LOGGING INFORMATION FLOW

- BETTER MUD DESIGN
- MAINTAIN OPTIMUM PRODUCTION
- DIAGNOSE PRODUCTION PROBLEMS
- SEISMIC CORRELATION
- HOLE GEOMETRIC INFORMATION
- BETTER DESIGN OF BHA
- CEMENT VOL & CEMENTING DATA

- MUD ENGINEERS
- PRODUCTION ENGINEERS
- GEOPHYSICISTS
- GEOLOGISTS
- RESERVOIR ENGINEERS
- DRILLING ENGINEERS

- BASIC SUBSURFACE DATA & INFORMATION
- FIND PROSPECTIVE ZONES
- RESERVES ESTIMATE
- RESERVOIR MAINTENANCE
Well Logging Department
At a Glance
WELL LOGGING DEPARTMENT

• Well Logging Department plays a pivotal role in the core business of the company i.e. Exploration & Production of Hydrocarbon

• The Department provides services in the different phases of Hydrocarbon E&P process

• The Department has introduced a number of sophisticated technology to bring about a paradigm change in the Hydrocarbon E&P process of the company
WELL LOGGING DEPARTMENT

• Established in 1979 to acquire in-house capability in Well Logging technology

• Since then, the department is continuing its journey to develop into a full-fledged mature department at present

• Besides Well Logging field services, the department is now capable to provide logged data interpretation and maintenance services of logging tools & equipments
WELL LOGGING DEPARTMENT

Resources available at present:

Man Power:

- Engineers/Officers = 42 Nos.
- Work Persons = 69 Nos.

The Department is headed by Head – Well Logging

Majority of the engineers are trained internationally to carry out:

- Various Logging Operations
- Interpretation of Logged Data
- Electromechanical Maintenance of Equipments
- Cater to any HSE issues
WELL LOGGING DEPARTMENT

Other Physical Resources available:

- Open Hole Logging Units with Tools
- Cased Hole Logging Units with Tools
- Mast Unit
- Data Interpretation Centre
- Fully Equipped Maintenance Laboratory
WELL LOGGING DEPARTMENT

Open Hole Logging Units with Tools:

• 01 no. Excel 2000 Logging Unit with DITS tools

• 02 nos. LOGIQ Logging Units with INSITE tools

✔ Can provide all basic logging services
✔ Has capability to provide some special imaging services
✔ All units are dual drum type for full service capability
Cased Hole Logging Units with Tools:

- 01 no. Single Drum Logging Unit with tools and accessories
- 02 nos. Double Drum Logging Units with tools and accessories

- All units are installed with PC based Warrior Logging systems and are fully digital in operation
- Can provide all basic cased hole logging services
- Special capability for Live (flowing) Well Operations including Production Logging Jobs
WELL LOGGING DEPARTMENT

Data Interpretation Centre:

- Equipped with IBM Work-Station & PC Based System
- Uses ULTRA software for basic log interpretation
- Capable of processing some Imaging services as well
- Production Log interpretation with “Kappa” software
- Equipped with Itera-lite & Itera-elite Colour Plotters and Printers
Well Logging Measurement Technique
WELL LOGGING TECHNIQUES

• Well Logging Measurements are carried out through the drilled borehole

• Measurements are recorded either in an Open Hole or a Cased Hole

• **Open Hole:**
  A borehole drilled in the formation, usually available immediately after drilling
  – All basic petrophysical measurements for Formation Evaluation

• **Cased Hole:**
  A borehole wherein steel casing pipes have been placed and cemented suitably
  – Measurements mostly concern with Reservoir Development & Production
Basic Well Logging Equipments

• **Logging Unit**
  – A specialized truck installed with a full computer system for data acquisition & processing

• **Logging cable or the Wireline**
  – An electro-mechanical cable reel mounted on the truck and operated by the truck hydraulics

• **Logging Tool or Sonde**
  – An electronic instrument containing sensors and processing circuitry for data acquisition and transmission

  The logging tool is lowered into the wellbore by means of the logging cable or wireline. The wireline also connects the logging tool electrically to the surface computer system. Data acquired by the tool are transmitted to the surface system over the logging cable using digital telemetry. The surface computer records, processes and plots these data as a function of well depth and produces what is called a “log” or “well log”.

• **This is normally called the Wireline Logging Technique**

BASIC FORMATION EVALUATION

- To estimate Hydrocarbon potential of a reservoir, we need to know
  - Porosity
  - Permeability
  - Water Saturation

- Well Logging measurements aim at determining these three main Petrophysical parameters of the earth formation
PETROPHYSICAL PROPERTIES OF ROCK

What Do We Need To Measure?

DENSITY?
TRAVEL TIME?
BED THICKNESS?
FLUID SAMPLES?

ROCK MATRIX

RESISTIVITY?
NEUTRON POROSITY?
RESERVOIR PRESSURE?
CORING?
Basic Well Logging Petrophysical Measurements:

- Natural Gamma Radioactivity
- Formation Resistivity
- Formation Density
- Formation Porosity
- Acoustic Travel Time
- Formation Pressure / Fluid Sampling / Coring
MEASUREMENT OF NATURAL GAMMA RAY

- Earth formations are radioactive due to presence of naturally occurring radioactive isotopes of Uranium, Thorium and Potassium
- Gamma Ray logging measures the natural Gamma radiations
- Applications:
  - To identify permeable zones, lithology
  - Shale volume calculation
  - Well depth correlation
FORMATION RESISTIVITY MEASUREMENT

• Resistivity is the physical property of a formation which impedes the flow of electric current.

• Resistivity is measured by the Resistivity Logging Tools like DLL, HRI, HRAI etc.

• Based on Induction or Latero-log (current focus) principle

• Applications
  • Determine the True Resistivity of the formation and depth of invasion.
  • Indicate the presence of movable hydrocarbons
FORMATION DENSITY MEASUREMENT

• Formation Bulk Density is measured by the Density Logging Tool

• Tool uses high energy gamma ray source (Cesium 137, 1.5 Curie) to allow interaction of gamma rays with formation atoms

Applications:
– Determine accurate formation porosity
– identify lithology
– delineate thin beds
– indication of gas when used in combination with a neutron log
NEUTRON POROSITY MEASUREMENT

- Porosity can be estimated from a variety of “porosity logs” (sonic, density, neutron, or magnetic resonance log)
- Neutron porosity logging is a nuclear technique based on neutron-nuclei interactions in the borehole environment
- Neutrons are emitted into the formation by an external Neutron source (AmBe 241, 18.5 Curie) mounted on the tool

Applications:
- To measure total porosity of formation for saturation calculation
- Gas detection in conjunction with density log
ACOUSTIC (SONIC) LOGGING

• Based on propagation of sound waves in the reservoir rock matrix and fluid filled pores

• Measures a number of formation sonic parameters like compressional & shear velocities and travel time using both monopole and dipole transmitters & receivers

• Uses:
  • Find porosity, identify lithology, gas detection
  • study rock mechanical properties, anisotropy analysis
  • seismic correlation & AVO study
  • Hydro-fracture evaluation etc.
SIDE WALL CORING

• To recover cores or samples from a prospective formation for analyzing in laboratory

• Application:
  – Porosity, permeability, fluid saturation estimation
  – Grain size & matrix determination
  – API oil gravity determination
  – Gas & oil presence
Specialized Logging Services
ELECTRICAL MICRO IMAGING TECHNIQUE

• Based on measurement of formation microconductivity with pad-mounted button electrodes.

• Provides a core-like image of the borehole wall with direction and orientation.

• Applications:
  • Detailed stratigraphic and sedimentological analysis
  • Thin bed delineation
  • Potential secondary porosity identification & Fracture analysis
  • Quantitative high-resolution resistivity for improved net pay estimation
  • Fault mapping & general structural analysis
VERTICAL SEISMIC PROFILING (VSP)

• Utilizes sensitive geophones to acquire high-quality seismic data from the borehole

• Uses:
  – enhancing and supplementing surface seismic data
  – Predict stratigraphy, lithology, and structure ahead of the drill bit to save drilling time and costs
Like its counterpart in Medical sciences, Nuclear Magnetic Resonance (NMR) technology is used in well logging to find:

- Total fluid-filled porosity
- Provide fluids-only measurement
- Identify low-resistivity pay within immovable water volumes
- Determine Permeability, fluid types and fluid contacts
Carbon/Oxygen (C/O) Logging is a pulsed neutron logging technique for monitoring and managing the production of hydrocarbon reserves.

- Accurately determine oil and gas saturations
- Identify bypassed reserves
- Pinpoint fluid contacts
- Identify lithologies and mineralogies
- Detect water flow behind casing pipe
WIRELINE FORMATION TESTING & SAMPLING

• Provides accurate reservoir pressure measurement and reservoir fluid samples

• Uses:
  – accurate, reliable hydrocarbon/fluid typing
  – improved permeability estimates
  – evaluate reservoir potential and plan well completions
LOGGING IN DIFFICULT CONDITIONS

• Conventional method wireline logging can not be used in case of highly deviated or horizontal wells or wells with severe downhole problems

• Techniques like Measurement While Drilling (MWD), Logging While Drilling (LWD) and Tool Pusher Logging (TPL) had been developed to transport logging tools into the well via drill pipes as part of drilling BHA

• Other methods of tool conveyance like Downhole Tractor, Well Shuttle etc. are also available
WELL LOGGING TECHNIQUES

- After acquisition of well logging data, interpretation and integration the data is carried out to locate, define and produce from a selected reservoir.

- Open hole is now “cased” by running in casing pipes into the borehole and cementing the pipes to surrounding formation.

- A number of well logging operations are carried out in a cased hole before the well is put to flow.
CASED HOLE LOGGING TECHNIQUES

• For development, Testing and Production completion of a well.

• Basic Cased Hole operations include:
  
  • Cased Hole Completion Logs
  
  • Well Perforation techniques
  
  • Production Logging
  
  • Cased Hole Formation Evaluation Logs
CASED HOLE LOGGING TECHNIQUES

Cased Hole completion Logs include:

- **Cement Bond Log**: To evaluate quality of cement bond between casing to cement and formation to cement

- **Gamma ray Log & Casing Collar Log**: For depth correlation

- **Neutron Log**: To know oil-water contact

- **Pulsed Neutron Log**: For reservoir saturation determination

- **Temperature Log**: For cement top determination
CASED HOLE LOGGING TECHNIQUES

Perforation

• To make holes in steel casing and cement & into the prospective formation so as to allow fluids to flow to the wellbore and finally to the surface

• Holes are created using high explosives (called shaped charges)

• Critical perforation parameters are
  • Entry Hole Diameter of the Shaped Charge
  • Total Target penetration of the Shaped charge
  • Shot Density (no. of shots per foot) fired
  • Shot orientation
CASED HOLE LOGGING TECHNIQUES

Production Logging Measurements include:

– Well Flow Rate measurements with various types of Flowmeters
– Pressure Measurements (Draw-down & build-up tests)
– Temperature, Fluid Density, Dielectric properties of fluid, gamma ray, etc.

Applications:

• Monitor reservoir performance for production/injection efficiency
• Diagnosis of production/injection problems
CONCLUSION

- Well Logging Techniques play a fundamental role in the Hydrocarbon E & P processes

- Integrated interpretation of well logging data can strongly reduce uncertainties in Formation Evaluation and in Reservoir Characterization studies

- Integration of formation evaluation data is an inter-disciplinary team work
